Electrical and Computer Engineering Department School of Engineering Rutgers University, Piscataway, NJ 08854 ECE Lab Report Structure

EXERCISE 1

Output:

The task: read all of the commented lines under the map function in "megalistmanips.s" (before it returns with jr ra), and make sure that the lines do what the comments say.

I made several changes in the code. First, i changed the line "add t1, s0, x0" to "lw t1, 0(s0)" since add would save the address where as lw would save the contents of s0 in t1. Since la is not a command, i looked at the comment to see the purpose of the time. To execute the comment, i changed la to lw. This caused issues when mul uses t1. Thus, instead of using the t1 register, i changed it to t3 in the code for mapLoop. Since the the offset is supposed to be index multiplied by 4, I added the line "slli t4, t0, 2" and stored the new offset in t4. All the changes made were in mapLoop and can be seen below. I have also included the output of the fixed code.

```
mapLoop:
     1w t3, 0(s0)
                         #load the address of the array of current
node into t3
        t2, 4(s0)
                    # load the size of the node's array into
     lw
t2
   slli t4, t0, 2
                         #the offset is supposed to be index
multiplied by 4
   add
          t3, t3, t4
                          # offset the array address by the count
          a0, 0(t3)
                          # load the value at that address into a0
     jalr s1
                          # call the function on that value.
          a0, 0(t3)
                         # store the returned value back into the
     SW
array
     addi t0, t0, 1
                          # increment the count
          t0, t2, mapLoop # repeat if we haven't reached the array
size yet
                          # load the address of the next node into
     ٦w
          a0, 8(s0)
a0
     add a1, s1, x0
                          # put the address of the function back
into al to prepare for the recursion
     jal
          map
                          # recurse
```

```
Lists before: 5 2 7 8 1 1 6 3 8 4 5 2 7 4 3 1 2 3 4 7 5 6 7 8 9 Lists after: 30 6 56 72 2 2 42 12 72 20 30 6 56 20 12 2 6 12 20 56 30 42 56 72 90
```

EXERCISE 2

Consider the discrete-valued function f defined on integers in the set $\{-3, -2, -1, 0, 1, 2, 3\}$. Here's the function definition:

```
function definition f(-3) = 6

f(-2) = 61

f(-1) = 17

f(0) = -38

f(1) = 19

f(2) = 42

f(3) = 5
```

Your task is to implement it in RISC-V, with the condition that your code may NOT use any branch instructions!

Notice that there is an array of integers in the .data section of "discrete_fn.s" How can you use this to your advantage and complete this task?

The .data section is used to see if the printed values match the answer.

EXERCISE 3
Task: Open this file with an editor (e.g., nano dump.txt) and try to find the main function.
